

This is CS50

Section, Week 9

TA: Andi Peng

Agenda

- Announcements
- Language Galore
- Javascript
- Objects
- DOM
- AJAX
- pset8 (last one woo!!)

Announcements

- Huge shoutout to Sam for teaching last week!
- Come get quizzes after section
- Quiz 1 next Wed/Thurs
 - Same format as Quiz 0, but focusing on material from Week 6 onwards
 - Q&A Monday 5:30pm
 - Review session in section next week
 - Q&A Office hours Mon/Tues

Resources

- Lecture notes + source code
- Section slides + source code
- cs50.yale.edu/shorts
- study.cs50.net
- cs50.net/discuss
- office hours
- Google
- Me!

C vs. PHP vs. HTML vs. CSS

- C: programming language
 - compiled and run
- HTML: markup language
 - structure and content
- CSS: style sheet language
 - look and feel
- PHP: server-side scripting language
 - functionality
 - only executed over the server

<https://www.youtube.com/watch?v=N9qYF9DZPdw>

Javascript

- Client-side scripting language
 - like PHP, is an interpreted language = no need to compile
 - like PHP, is loosely bound (var)
 - programs written in Javascript run in the web browser
- Javascript
 - program automatically fetched by browser
 - executed on computer
- PHP
 - program runs on web host's computer
 - sends result to visitor's browser, which displays the results

jQuery

Javascript library

// in index.html

```
<script src = "js/jquery.js"><script>
```

```
<script src = "js/scripts.js"><script>
```

// in index.js

```
$(document).ready(function(){
```

```
    // TODO
```

```
});
```

Hello World

index.html:

```
<!DOCTYPE html>
  <html>
    <head>
      <script type="text/javascript"
src="hello.js">
    </script>
      <title>Hello, world!</title>
    </head>
    <body>
      Body HTML here
    </body>
  </html>
```

hello.js:

```
alert("Hello, world!");
```

Hello World

Variable Declarations

Loosely-typed

Global

```
x = 3.14;  
x = "CS50";  
x = true;
```

Local

```
var x = 3.14;
```

...

```
alert("Type of b: " + typeof(b));  
b = "make b a string";  
alert("Type of b: " + typeof(b));
```

Loops

```
for(/* init */; /* condition*/; /* update */)
{
    /* code */
}
```

```
while(/* condition */)
{
    /* code */
}
```

```
do {
    /* code */
} while(/* condition */);
```

Function Declarations

```
function sum(x, y)
{
    return x + y;
}
```

/* or */

```
var sum = function(x, y)
{
    return x + y;
}
```

```
var sum = sum(3, 5);
alert("3 + 5 = " + sum);
```

Arrays in JavaScript

```
var array = [];
```

```
var array2 = ["Arrays", "in", "JS"];  
var thirdElement = arr2[2];
```

```
var arr2len = arr2.length;
```

```
var array3 = [2.3, true, 5];  
array3[2] = "not a number";  
array3[100] = "legit";
```

Objects

- Collections of data
- Similar to what other data types we've learned about?
- key: value access

- Two ways to access properties:
 - 1. dot notation
 - 2. square brackets

Objects in JavaScript (1)

object = complex data type

```
var fruit = {};
```

```
fruit["type"] = "strawberry";  
fruit.color = "red";
```

```
alert(fruit.type);  
alert(fruit["type"]);
```

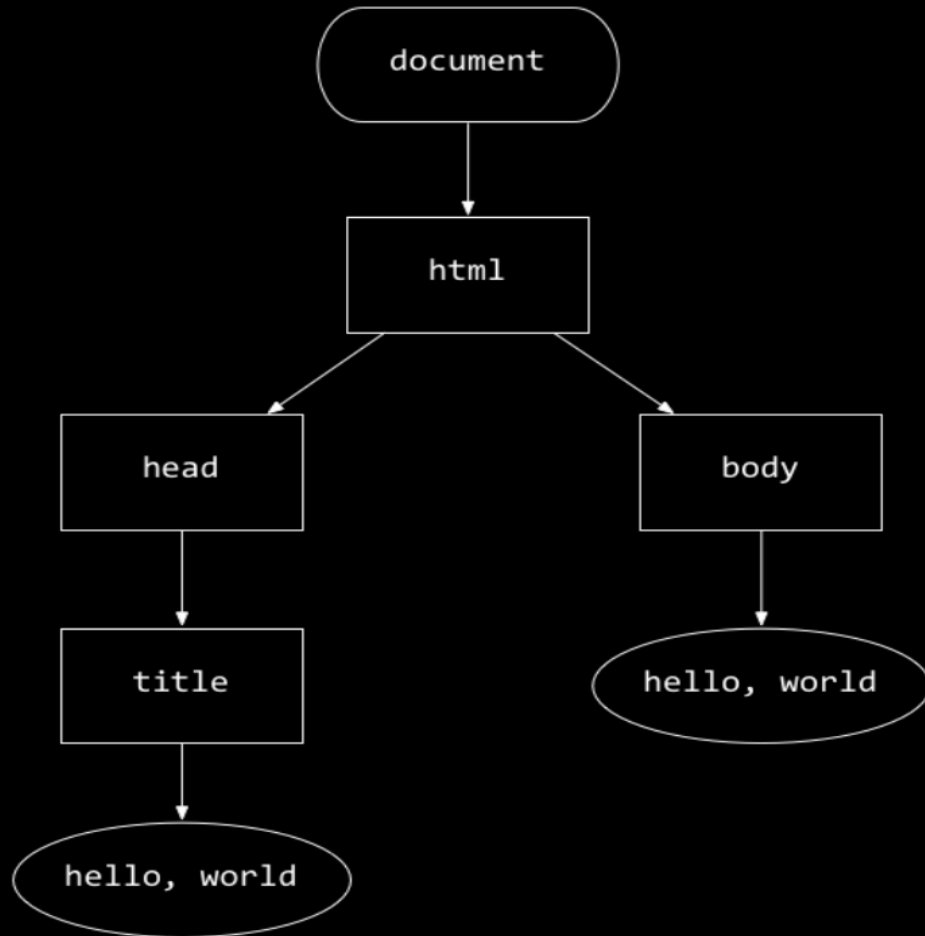

Objects in JavaScript (2)

```
var fruit = {  
  type: "strawberry",  
  color: "red",  
  size: 4;  
  sweet: true;  
  showType: function(){  
    console.log("This is " + this.type);  
  }  
};
```

Objects in JavaScript (3)

```
var heads = [  
  {name: "Andi", college: "Berkeley"},  
  {name: "Jason", college: "Silliman"},  
  {name: "Scaz", college: "MIT"}  
];  
  
for(var i = 0; i < heads.length; i++)  
{  
  alert(heads[i].name);  
}
```

DOM: Document-Object Model

```
<!DOCTYPE html>
```

```
<html>
```

```
<head>
```

```
<title>hello, world</title>
```

```
</head>
```

```
<body>
```

```
hello, world
```

```
</body>
```

```
</html>
```

DOM: Document-Object Model (2)

Examples

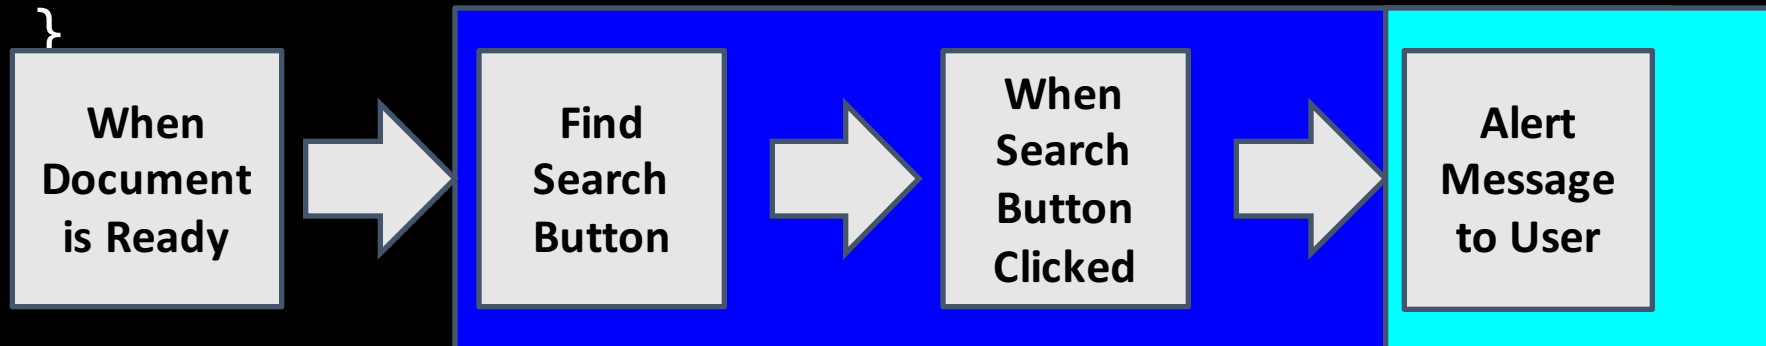

- `document.title`
- `document.body`
- `document.body.innerHTML`

Useful Functions

- `document.getElementById(string)`
- `document.getElementsByClassName(string)`
- `document.getElementsByTagName(string)`

JavaScript Events

```
window.onload = function() {  
  
    var searchButton =  
        document.getElementById("search_button");  
  
    searchButton.onclick = function() {  
        alert("You clicked the search  
button");  
    }  
}
```

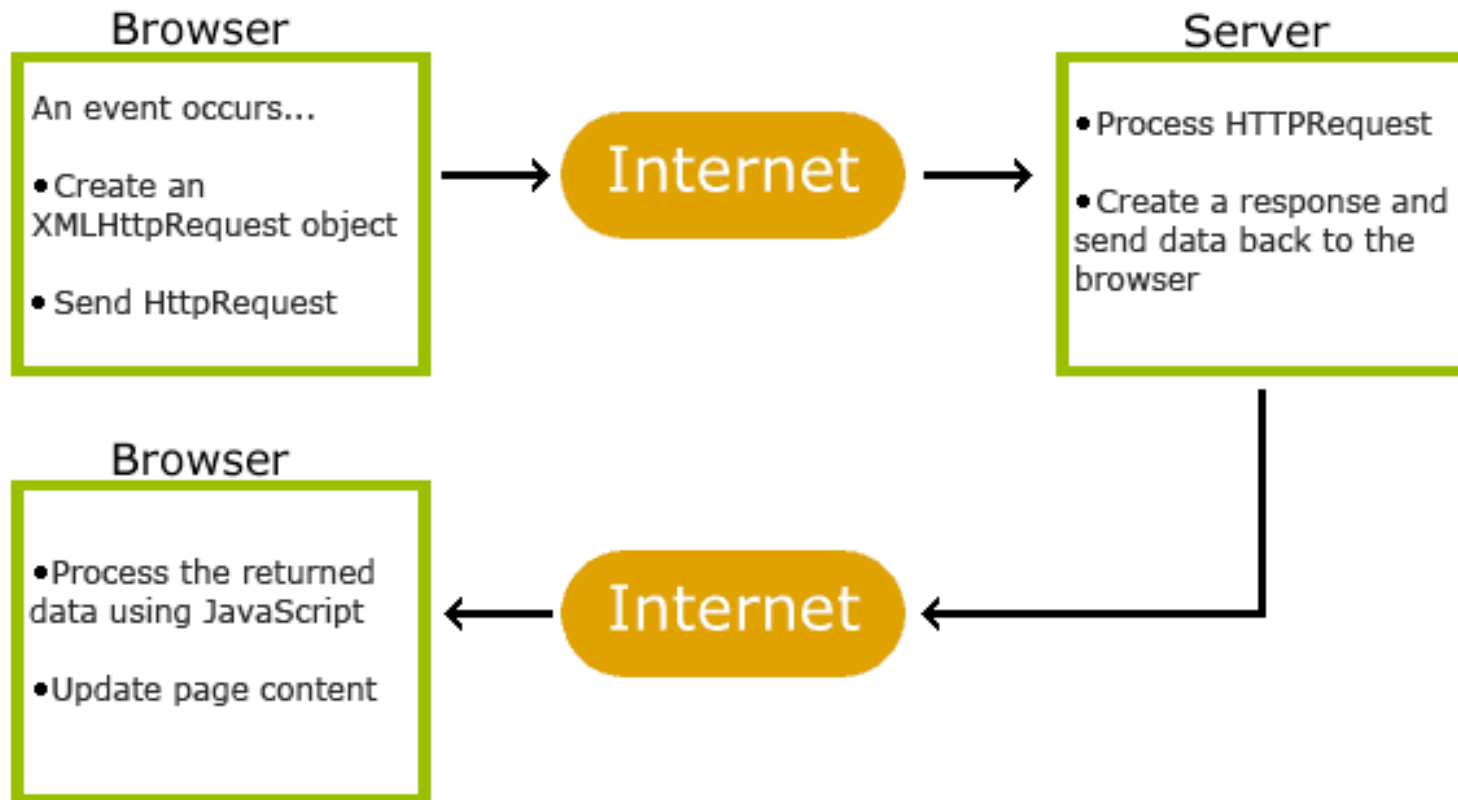

Challenges

In your pset8 spec:

1. Write a function `properties` that prints out the key-value pairs of the Javascript object `obj`
2. Change the background color of header to blue
3. Change the title of the pset to "I Made It Through CS50"

AJAX

How AJAX Works

Pset8: Mashup

- `import()`
- `addMarker()`
- `removeMarkers()`
- `search.php`
- `configure()`
