

A brief intro to

CS61

Systems Programming and Machine Organization

Prof. Matt Welsh

Harvard University

December 13, 2007

CS61

New course in Spring 2008: Tuesday/Thursday 2:30-4:00

Prerequisites: CS50 (or C programming experience)

Can be used for CS concentration breadth requirement (“middle digit”)

Can be used for CS secondary area requirement

You can, and should, take both CS51 and CS61 at the same time!

What is CS61 all about?

- Revealing the mystery of how machines really work!
- Getting “under the hood” of programming at the machine level
- Understanding what affects the performance of your programs:
 - Processor architecture
 - Caching and memory management
 - Processes, threads, and synchronization
- Writing rock solid (and fast) systems code

Why CS61?

- Huge gap between the *concepts* of programming and the *reality*
- This gap is more profound when you start programming in higher-level languages: Java, C++, Scheme, etc.
- Need to understand how machines really work to grasp:
 - Operating Systems
 - Databases
 - Processor Architecture
 - Compilers
 - Networks
- ... and even just to be a good programmer, even if you don't become a Computer Scientist.

Restart and set the recovery options in the system control panel
or the /CRASHDEBUG system start option. If this message reappears,
contact your system administrator or technical support group.

How many times have you seen this?

```
% gcc -o myawesomeprogram map.c  
  
% ./myawesomeprogram  
segmentation fault - core dumped  
  
%
```

```
% gdb myawesomeprogram core
```

```
(gdb) where
```

```
#0 0x00001fea in main ()
```

```
(gdb) disass
```

```
Dump of assembler code for function main:
```

```
0x00001fc6 <main+0>:    push    %ebp
0x00001fc7 <main+1>:    mov     %esp,%ebp
0x00001fc9 <main+3>:    sub     $0x28,%esp
0x00001fcc <main+6>:    movl   $0x200,(%esp)
0x00001fd3 <main+13>:   call   0x3005 <dyld_stub_malloc>
0x00001fd8 <main+18>:   mov     %eax,-0x10(%ebp)
0x00001fdb <main+21>:   movl   $0x0,-0xc(%ebp)
0x00001fe2 <main+28>:   jmp    0x1ff2 <main+44>
0x00001fe4 <main+30>:   mov     -0xc(%ebp),%eax
0x00001fe7 <main+33>:   add     -0x10(%ebp),%eax
0x00001fea <main+36>:   movb   $0x42,(%eax)
0x00001fed <main+39>:   lea    -0xc(%ebp),%eax
0x00001ff0 <main+42>:   incl   (%eax)
0x00001ff2 <main+44>:   cmpl   $0x270ffff,-0xc(%ebp)
0x00001ff9 <main+51>:   jle    0x1fe4 <main+30>
0x00001ffb <main+53>:   leave
0x00001ffc <main+54>:   ret
End of assembler dump.
```

Hacking into my account...

- Say I left a program in my home directory that would run a shell as “mdw” if you gave it the right password.

```
% cd /home/mdw
% ./mdwshell
% Enter the password: *****(password)
Congratulations! Running shell...

$ whoami
mdw
```

How would you figure it out?

- Brute force guess? No dice ...

```
% cd /home/mdw
% ./mdwshell
% Enter the password: lameguess
Sorry, wrong!
Emailing President Faust...

%
```

How would you figure it out?

- What if you could read the executable file?

```
% cat mdwshell
ELF@4E4 ($!444ààüüüüü$LÐÐ(((
Qåtd/lib/ld-linux.so.2GNU)E
¬KãÀgUa Hy\²0B)óA9U 6N@` ;

Disassembly

<code>push</code>	<code>%ebp</code>	▶ Put the ebp register on the stack
<code>mov</code>	<code>%esp,%ebp</code>	▶ Copy stack pointer to ebp register
<code>sub</code>	<code>\$0x14,%esp</code>	▶ Subtract 20 bytes from stack pointer
<code>mov</code>	<code>0x8049814,%eax</code>	▶ Move 0x8049814 to eax register
<code>mov</code>	<code>%eax,-0x4(%ebp)</code>	▶ Move eax register to local variable
<code>jmp</code>	<code>8048521</code>	▶ Jump to address 0x804521
<code>mov</code>	<code>0x8(%ebp),%eax</code>	▶ Copy 2 nd argument to eax register

Disassembly

<code>push %ebp</code>	▶ Put the ebp register on the stack
<code>mov %esp,%ebp</code>	▶ Copy stack pointer to ebp register
<code>sub \$0x14,%esp</code>	▶ Subtract 20 bytes from stack pointer
<code>mov 0x8049814,%eax</code>	▶ Move 0x8049814 to eax register
<code>mov %eax,-0x4(%ebp)</code>	▶ Move eax register to local variable
<code>jmp 8048521</code>	▶ Jump to address 0x804521
<code>mov 0x8(%ebp),%eax</code>	▶ Copy 2 nd argument to eax register

- Hmmmm ... seems kind of complex.
 - Until you take CS61 that is...

- What's this?

```
mov 0x8049814,%eax
```

Looks interesting.

Disassembly

```
% objdump -s mdwshell
...
Contents of section .data:
 8049808 00000000 00000000 00970408 ac860408 .....
```

↑
This is 0x8049808

↑
This is 0x8049814

- This is what the “check_password” routine is looking at. How do we read it?
- Well, the x86 is a **little-endian** processor...
 - Meaning, a four-word byte is stored with the **least** significant byte **first!**
 - So, ac 86 04 08 == 0x080486ac
 - Hmm, that looks like another memory address....

Disassembly

This is 0x80486a4

This is 0x80486ac

Must be the password

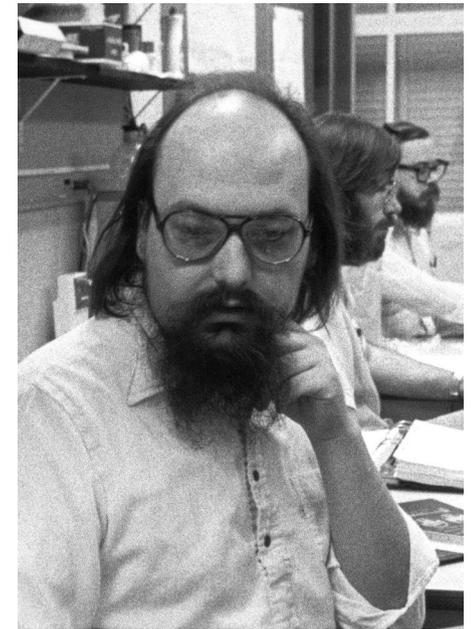

```
80486a4 03000000 01000200 74616b65 63733631 .....takecs61
80486b4 00456e74 65722074 68652070 61737377 .Enter the passw
80486c4 6f72643a 2000436f 6e677261 74756c61 ord: .Congratula
80486d4 74696f6e 7321002f 62696e2f 73680059 tions!./bin/sh.Y
```

“Hack this Binary” Contest

- 1) Go to the CS61 web page:
<http://www.eecs.harvard.edu/~mdw/course/cs61>
- 2) Click on “Binary hacking contest” link at the top
- 3) First one to hack the binary wins a prize (TBD)
- 4) Have fun :-)

Ken Thompson's Compiler Hack

- Ken Thompson – Co-inventor of UNIX
- Won Turing Award in 1983 (with Dennis Ritchie)
- During his award lecture, made a stunning admission...

Thompson's Compiler Hack

- Early days of UNIX: Thompson hacked the “login” program
 - Would accept a “magic” password to let him login on any UNIX system
 - Really helpful for debugging ...
- Problem: The source code for “login.c” was widely distributed
 - The whole system was “open source” (before we had that term...)
 - So, anyone could find the backdoor code!
- So, he hacked the C compiler...
 - C compiler would recognize that it was compiling “login.c”
 - Insert the backdoor code in at compile time

Thompson's Compiler Hack

- Now the backdoor was in the compiler code.
What if someone read that?
- He hacked the *compiler* to recognize when it was compiling *itself*
 - The compiler was itself implemented in C.
 - (Chicken and egg problem: How did they write the first C compiler?)
- The compiler would insert the backdoor code into itself!
 - So when the compiler compiles itself, it would insert the backdoor code to recognize when it was compiling login.c, to insert the backdoor code to check for the magic password. Got it?
- He then deleted the original compiler source code.
 - The backdoor could only be found in the *binary!*

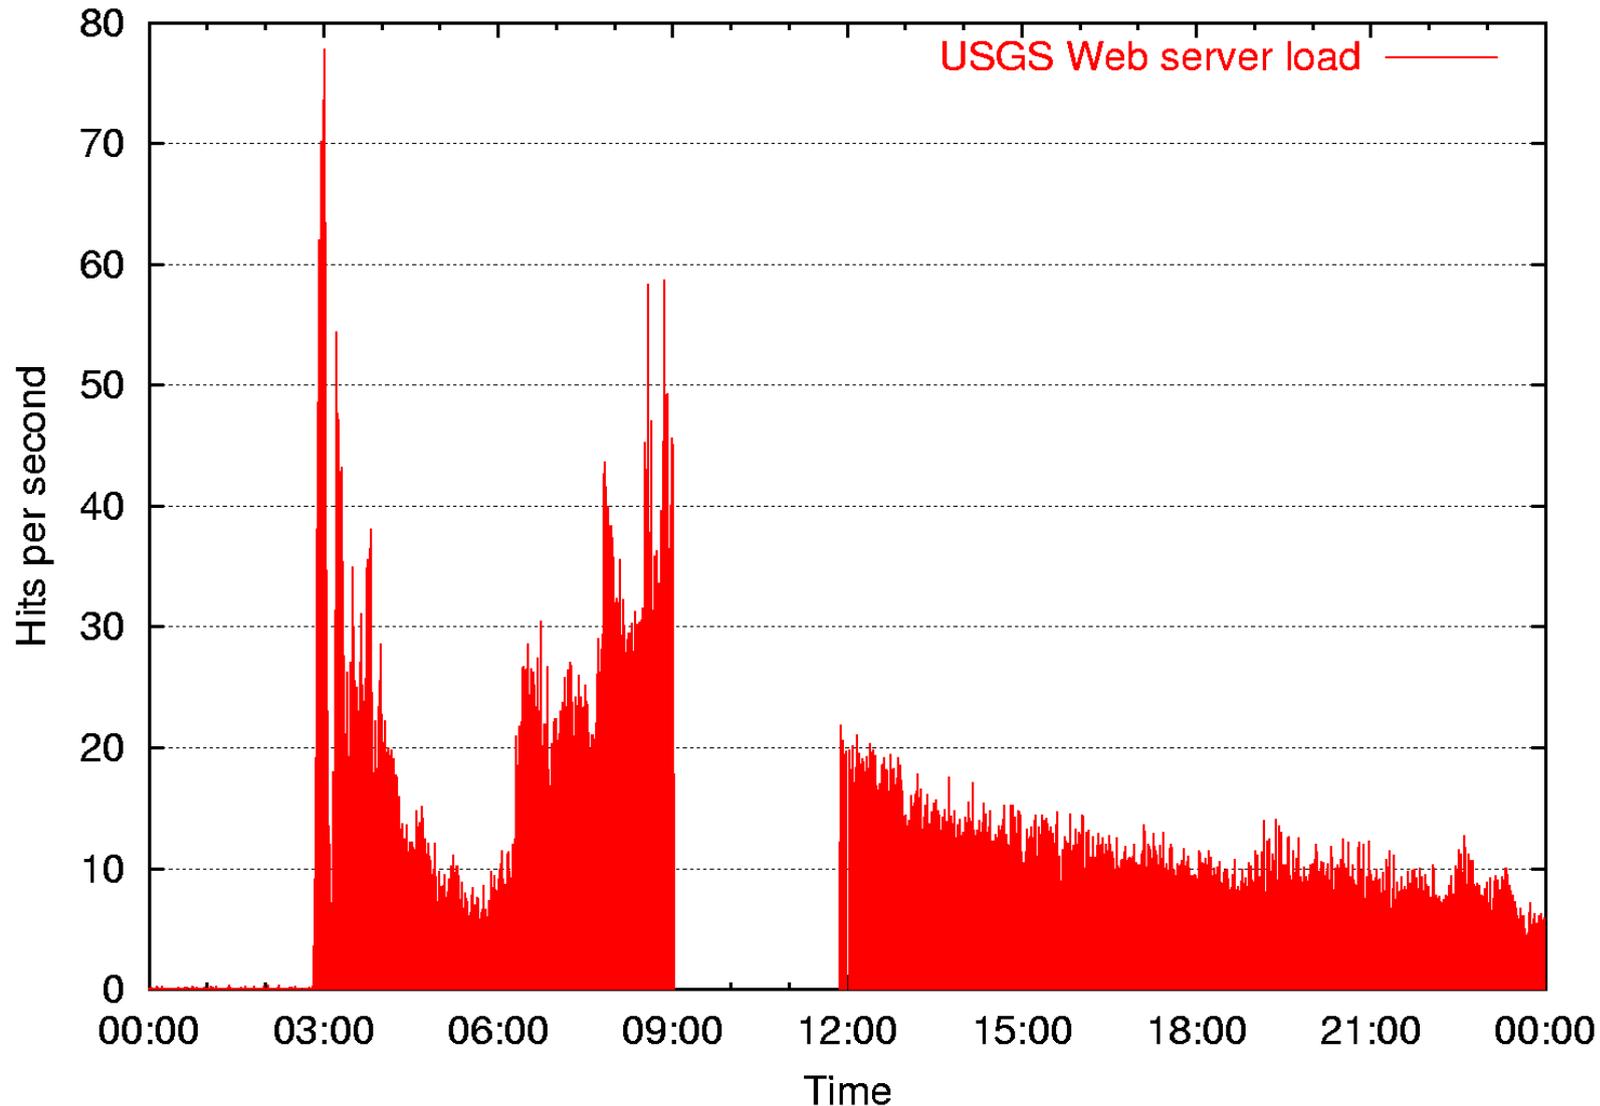

Building Robust Internet Servers

- Imagine you are running Amazon, Yahoo, or Google.
- How do you design your software to handle massive load?
- Tens of thousands of clicks *a second*
- Extremely bursty demand
- Service must be up and running 24/7 with no (discernible) outages
- This is a hard problem!

Overload on the Internet

- Any reasonably popular service on the Internet will experience overload
 - User populations are approximately infinite
 - User demand can be highly correlated (“flash crowds”)
- The peak load can be **orders of magnitude** larger than the average!
- Some examples:
 - CNN on Sept 11, 2001: 30,000 hits/sec, down for 2.5 hours
 - E*Trade sued in class-action lawsuit for not executing trades on time
 - Final Fantasy XI launch in Japan caused all servers to go down for 2 days
- The “Slashdot effect” -- daily frustration to nerds everywhere

God's version of the Slashdot effect

- M7.1 earthquake at 3:00 a.m., October 16, 1999

Why take CS61?

- Learn how machines really work.
 - Use gdb and objdump like an expert.
- Debug the hardest (and most interesting) bugs.
 - Stuff that only makes sense when you can read assembly.
- Hacking binaries for fun and profit.
 - How did the iPhone get jailbroken? The Code Red virus spread so quickly?
- Measure and improve the performance of your programs.
 - Understand memory hierarchies, processor pipelines, and parallelism.
- Write concurrent, multi-threaded programs like a pro.
 - The basis for every application and server on the Internet today.

Er, this sounds really hard...

- CS61 is **not** intended to be a heavy workload course.
 - Challenging, but fun.
 - Intended for everyone who has taken CS50 – not just CS concentrators
- Five lab assignments – can work in pairs:
 - 1) Defusing a binary bomb
 - 2) Hacking a buffer overrun bug
 - 3) Implementing dynamic memory allocation
 - 4) Writing your own UNIX shell
 - 5) Building a concurrent Internet service.
- Two midterms in class. Take-home final exam. That's it.

CS61

CS51

Or take both!

Topics to be covered

- Intel x86 assembly language programming
 - Registers, memory, control flow, procedures, data structures
- Performance measurement and program optimization
- Linking and loading
- Memory hierarchy, caching, and dynamic memory allocation
- UNIX systems programming: files, pipes, signals, processes
- Threads and synchronization
- UNIX sockets programming
- Implementing concurrent servers

Questions?

- Email me! mdw@eecs.harvard.edu
- Or drop by Maxwell Dworkin 233
