### Data Analysis in R

@dustinvtran Engineering and Applied Sciences @ Harvard University

# 1. introduction

#### What is R?

• R is a language developed for statistical computing and visualization

#### What is R?

- R is a language developed for statistical computing and visualization
- It is free and open source

#### What is R?

- R is a language developed for statistical computing and visualization
- It is free and open source
- It is a dynamic, lazy, functional, and object-oriented language

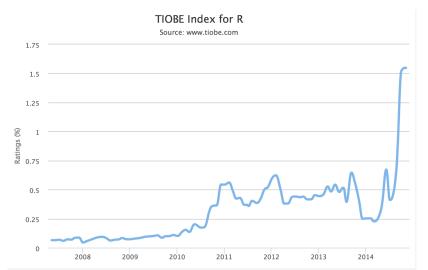

THE REASON I AM SO INEFFICIENT

#### Bottlenecks

• The biggest bottleneck in data analysis is cognitive.

#### Bottlenecks

- The biggest bottleneck in data analysis is cognitive.
- You need tools (domain specific languages) to help you define the problem and express solutions programmatically.

R...

 has an enormous number of packages for statistical modelling, machine learning, visualization, and importing and manipulating data

#### R...

- has an enormous number of packages for statistical modelling, machine learning, visualization, and importing and manipulating data
- is designed to interface with high-performance computing languages such as Fortran and C++.

#### R...

- has an enormous number of packages for statistical modelling, machine learning, visualization, and importing and manipulating data
- is designed to interface with high-performance computing languages such as Fortran and C++.
- can also integrate web visualizations from JavaScript libraries such as D3.js, Leaflet, Google Charts.

2. fundamentals

```
2 * pi
7 + runif(1)
sqrt (4<sup>4</sup>)
log(10)
log(100, base=10)
23 %% 2 # 23 mod 2
23 %/% 2 # floor(23/2)
5e9 * 1e3 # 5000000000 * 1000
```

```
val <- 3
val
print(val)
val = 1:6
val
```

• Vector: vector of some type (all entries are same type)

```
nums < c(1.1, 3, -5.7)
devs <- rnorm(2)
devs
ints <- c(1L, 5L, -3L)
ints
```

```
chars <- c('arthur', "marvin's",
           "marvin\"s")
chars
bools <- c(TRUE, FALSE, TRUE)
bools
```

```
vals < seq(2, 12, by=2)
vals
vals[3]
vals[3:5]
vals[c(1, 3, 6)]
vals[-c(1, 3, 6)]
vals[c(rep(TRUE, 3), rep(FALSE, 4))]
```

```
set.seed(42)
vals <- rnorm(3)</pre>
vals
vals[1:2] <- 0
vals
```

vals[vals != 0] <- 5

vals

```
vec1 <- 1:3
vec2 <- 3:5
vec1 + vec2
## [1] 4 6 8
vec1 * vec2
## [1] 3 8 15
vec1 >= vec2
## [1] FAISE FAISE FAISE
```

- Vector: vector of some type (all entries are same type)
- Matrix: matrix of some type (all entries are same type)

```
mat \leftarrow matrix(1:9, nrow = 3)
dim(mat)
class(mat)
t(mat) %*% mat
```

- Vector: vector of some type (all entries are same type)
- Matrix: matrix of some type (all entries are same type)
- Data frame: collection of columns (each column can be a different type)

- Vector: vector of some type (all entries are same type)
- Matrix: matrix of some type (all entries are same type)
- Data frame: collection of columns (each column can be a different type)
- List: collection of objects

```
list(stuff = 3,
    mat = matrix(1:4, nrow = 2),
    moreStuff = "china",
    list(5, "bear"))
```
