• In linear search, the idea of the algorithm is to iterate across the array from left to right, searching for a specified element.

In pseudocode:

- Repeat, starting at the first element:
 - If the first element is what you're looking for (the target), stop.
 - Otherwise, move to the next element.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

11 23 8 14 30 9 6 17 22 28 25 15 7 10 19

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

In pseudocode:

Repeat, starting at the first element:

If the first element is what you're looking for (the target), stop.

- Worst-case scenario: We have to look through the entire array of *n* elements, either because the target element is the last element of the array or doesn't exist in the array at all.
- **Best-case scenario**: The target element is the first element of the array, and so we can stop looking immediately after we start.

O(n) Ω(1)
