when searching for nodes matching some text, make sure only whole words match rather than substrings. this fixes cases where unexpected results show up for short query strings.

  use word boundaries for nodesMatching ...

@ummcheng lemme know what you think of this change! was using the extension for a bit, and noticed that I'd get multiple link matches when I didn't expect it (e.g., I said `click hack` and it also matched a link with `hacker`). this might be overly restrictive, though—want to hear your thoughts.

Member

This makes sense to me!

 tmacwill merged commit `566f0f3` into `master` 22 days ago

```
40  async pollFileLanguage() {
41    // Get a minimum amount of data from plugins to update the client's
42    // mode indicator.
43 -   if (this.hasPlugin()) {
44 -     let editorState = await App.clientManager.sendResponseToActive({
45       execute: {
46         commandsList: [
47           {
48             type: "COMMAND_TYPE_GET_EDITOR_STATE",
```

```
28  async pollFileLanguage() {
29    // Get a minimum amount of data from plugins to update the client's
30    // mode indicator.
31 +   if (this.pluginConnected()) {
32 +     let editorState = await App.pluginManager.sendResponseToActive({
33       execute: {
34         commandsList: [
35           {
36             type: "COMMAND_TYPE_GET_EDITOR_STATE",
37 +     limited: true,
```

ummcheng 6 days ago

It sounds like we need to update all the editor plugins to recognize this flag?

Architecture

Monolith vs. Microservices

Monolith vs. Microservices

Monolith

- Single repository
- Tight coupling
- Unified standards
- Shared tooling
- Google, Facebook

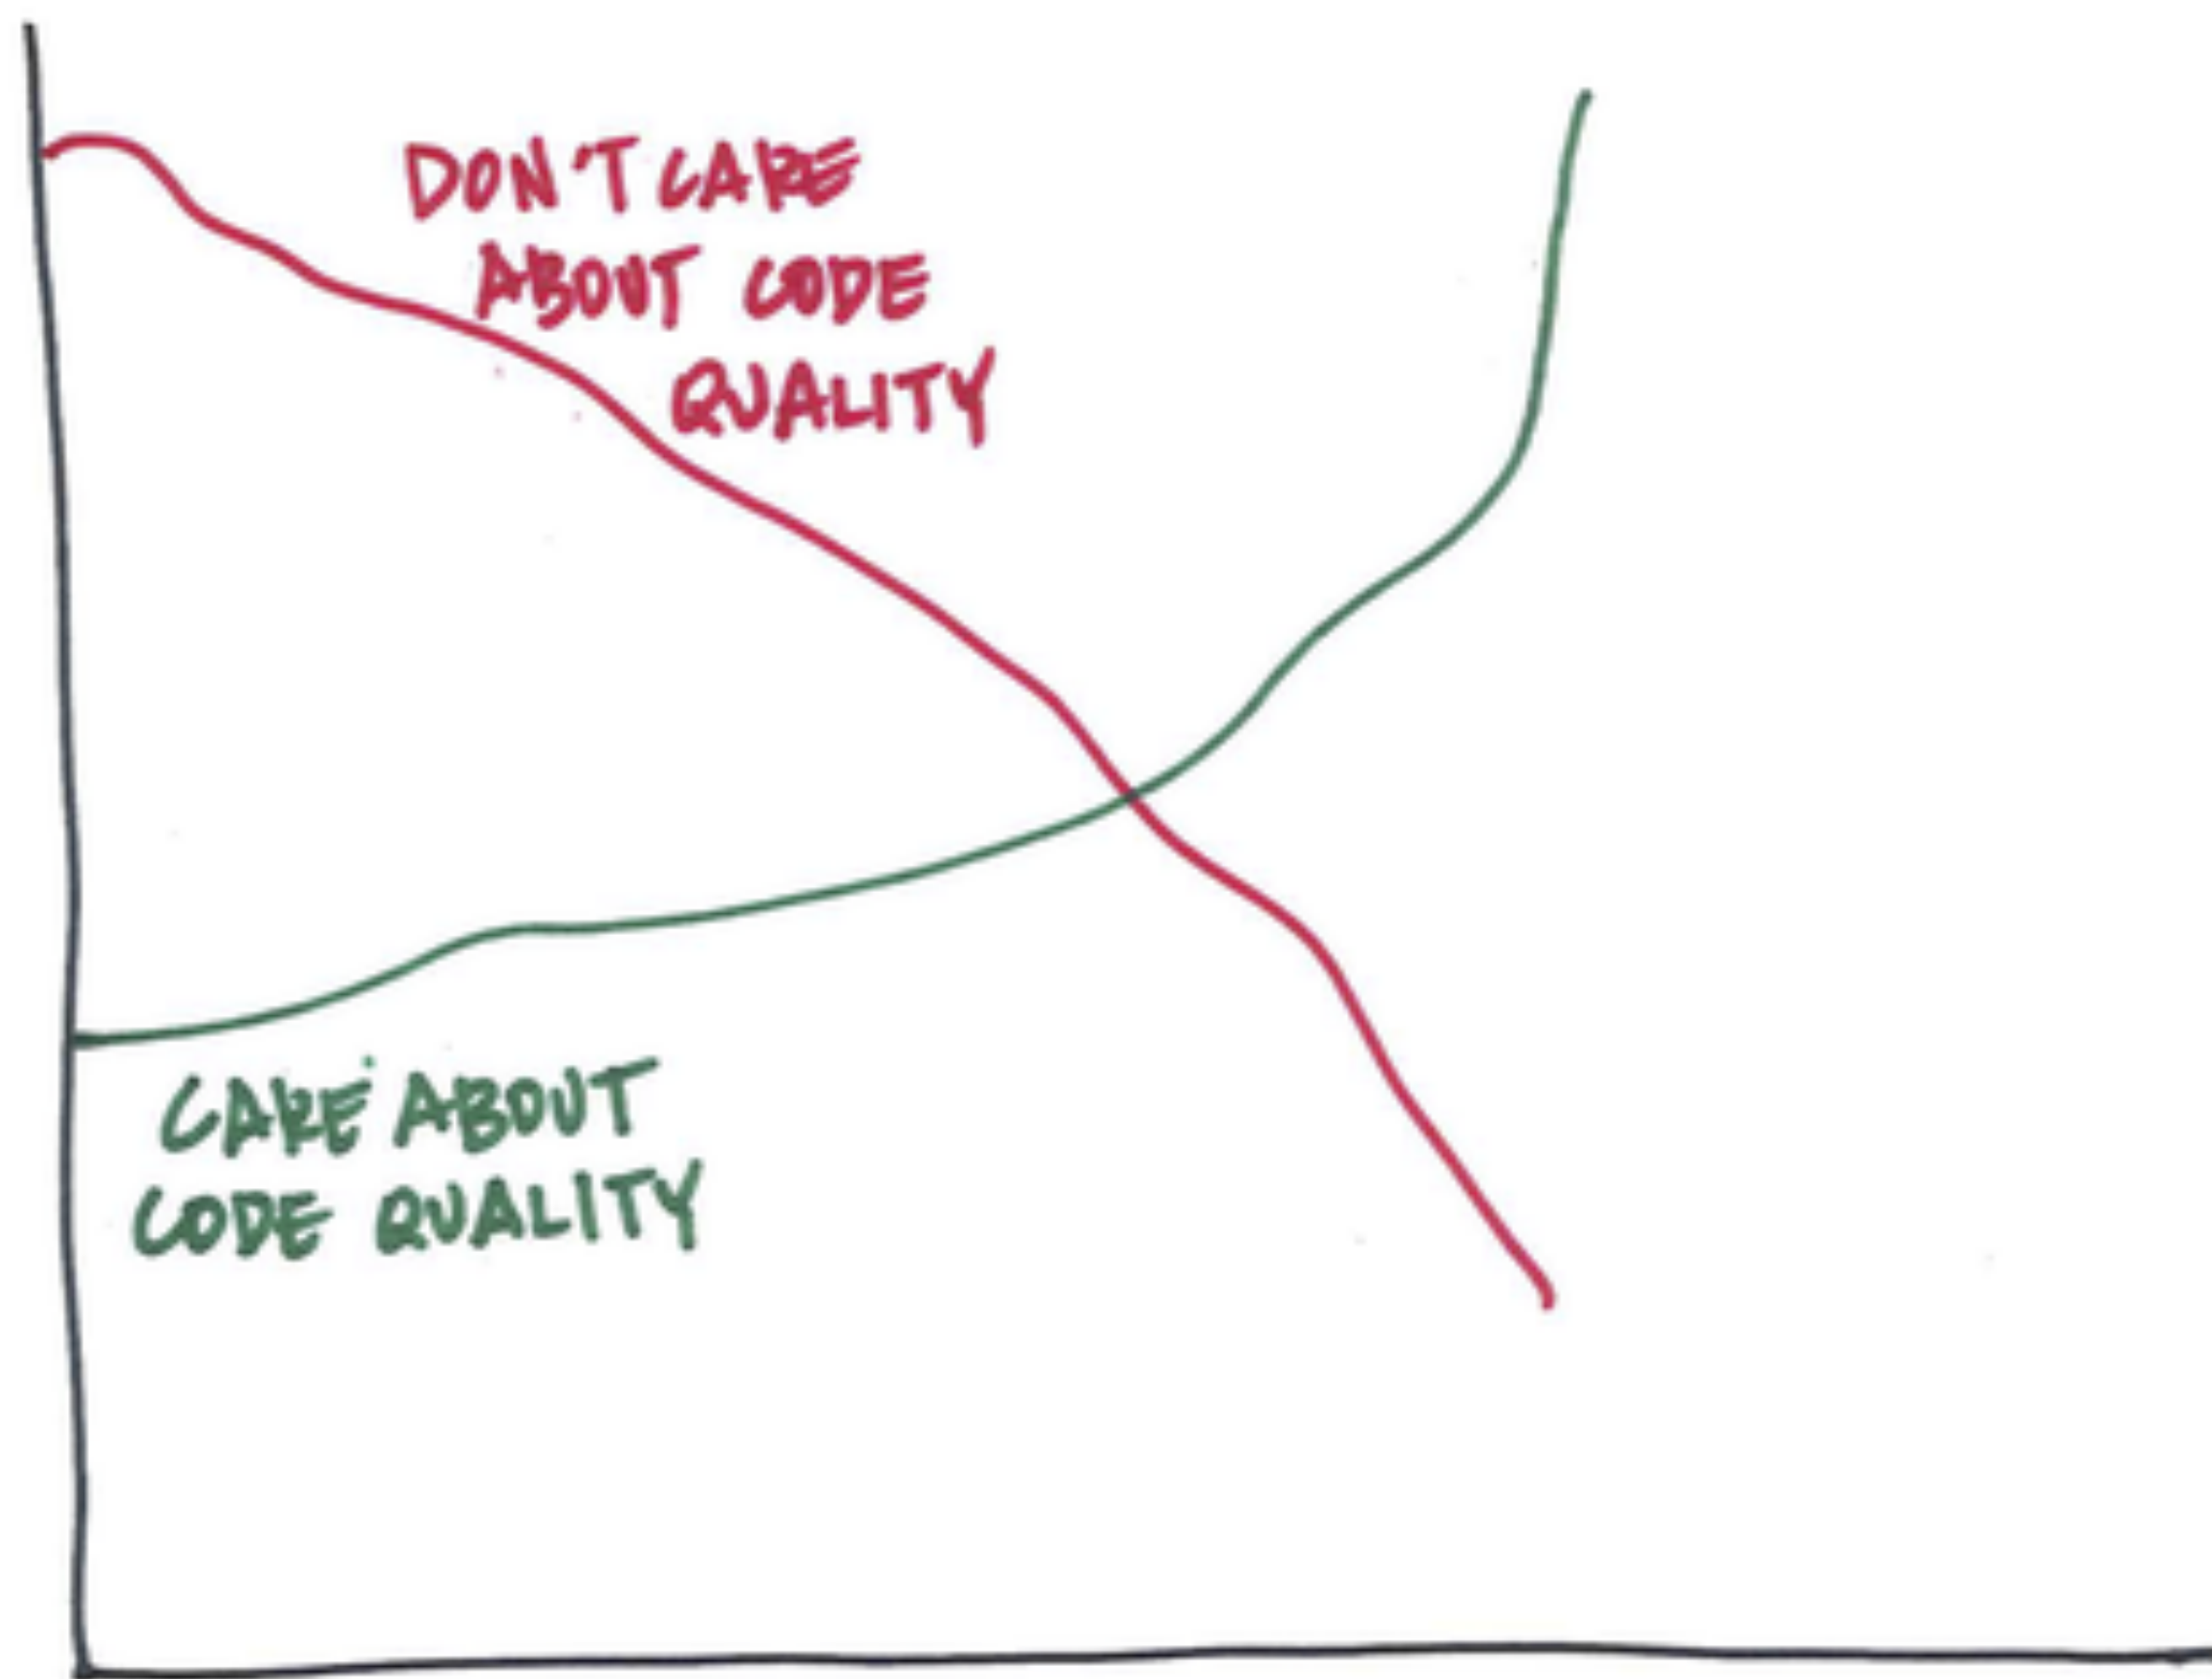

Microservices

- Many repositories
- Hard boundaries
- Per-service standards
- Service-specific tooling
- Uber, Netflix

Tradeoffs

Code Quality

VELOCITY

TIME

Technical Debt

Technical Debt

- Cutting corners
- Patching old systems
- Context loss

DRY

DRY

Don't Repeat Yourself

```
def display_items():
    items = get_inventory()
    for item in items:
        print(f"Price: {item['price']}")

def display_cart():
    items = get_cart()
    for item in items:
        print(f"Price: {item['price']}")
```

```
def display(items):  
    for item in items:  
        print(f"Price: {item['price']}")  
  
def display_items():  
    display(get_inventory())  
  
def display_cart():  
    display(get_cart())
```

Abstractions

Abstractions

- Getting data from a database
- Formatting data for an API
- Communicating with servers
- Handling errors

Idealized Project Execution

Real-world Project Execution

Tradeoffs

Build

Test

Launch

Software Testing

Unit Testing

- Test a single piece of functionality
- Fully independent tests
- Runs isolated code

```
def test_share():  
    file = create_file()  
    assert file["editors"] == 1  
    share_file(file, user)  
    assert file["editors"] == 2
```

Integration Testing

- Testing an entire flow
- Lots of dependencies
- Can run on real data

```
def test_new_file():  
    load_url("https://figma.com")  
    log_in("tommy", "password")  
    click("New File")  
    type("My Filename")  
    ...
```

Regression Testing

- New changes shouldn't break existing functionality
- Test other features with your new code

Acceptance Testing

- Does this meet the spec?
- Beta programs, insider releases

Performance Testing

- Simulate high system load
- Simulate components failing

Company 1

- B2B company for medical records
- Contracts include reliability SLAs
- 50 employees

Company 1 Strategy: Scheduled

- Tuesday: Code freeze
- Tuesday night: QA team tests
- Wednesday: Staged rollout to “insider” customers
- Thursday: Wide rollout
- Friday: Release critical patches

Company 2

- Consumer social network
- Ad-based revenue
- 5000 employees

Company 2 Strategy: Continuous

- Every few hours:
 - Full suite of tests runs on latest code
 - Employee version switches to latest code for an hour
 - Release if no red flags
- Bugs? Fix in the next release
